170 INTEGRALS

Theorem 3. Suppose that a function f is analytic inside and on a positively oriented circle C_R , centered at z_0 and with radius R (Fig. 69). If M_R denotes the maximum value of |f(z)| on C_R , then

Inequality (2) is called *Cauchy's inequality* and is an immediate consequence of the expression

$$f^{(n)}(z_0) = \frac{n!}{2\pi i} \int_{C_R} \frac{f(z) dz}{(z - z_0)^{n+1}} \quad (n = 1, 2, \ldots),$$

which is a slightly different form of equation (6), Sec. 51, when n is a positive integer. We need only apply the theorem in Sec. 43, which gives upper bounds for the moduli of the values of contour integrals, to see that

$$|f^{(n)}(z_0)| \le \frac{n!}{2\pi} \cdot \frac{M_R}{R^{n+1}} 2\pi R \quad (n = 1, 2, \ldots),$$

where M_R is as in the statement of Theorem 3. This inequality is, of course, the same as inequality (2).

EXERCISES

1. Let *C* denote the positively oriented boundary of the square whose sides lie along the lines $x = \pm 2$ and $y = \pm 2$. Evaluate each of these integrals:

$$(a) \int_{C} \frac{e^{-z} dz}{z - (\pi i/2)}; \qquad (b) \int_{C} \frac{\cos z}{z(z^{2} + 8)} dz; \qquad (c) \int_{C} \frac{z dz}{2z + 1};$$

$$(d) \int_{C} \frac{\cosh z}{z^{4}} dz; \qquad (e) \int_{C} \frac{\tan(z/2)}{(z - x_{0})^{2}} dz \quad (-2 < x_{0} < 2).$$
Ans. (a) $2\pi;$ (b) $\pi i/4;$ (c) $-\pi i/2;$ (d) 0; (e) $i\pi \sec^{2}(x_{0}/2).$

2. Find the value of the integral of g(z) around the circle |z - i| = 2 in the positive sense when

(a)
$$g(z) = \frac{1}{z^2 + 4}$$
; (b) $g(z) = \frac{1}{(z^2 + 4)^2}$.
Ans. (a) $\pi/2$; (b) $\pi/16$.

SEC. 52

3. Let *C* be the circle |z| = 3, described in the positive sense. Show that if

$$g(z) = \int_C \frac{2s^2 - s - 2}{s - z} \, ds \qquad (|z| \neq 3),$$

then $g(2) = 8\pi i$. What is the value of g(z) when |z| > 3?

4. Let C be any simple closed contour, described in the positive sense in the z plane, and write z

$$g(z) = \int_C \frac{s^3 + 2s}{(s-z)^3} \, ds$$

Show that $g(z) = 6\pi i z$ when z is inside C and that g(z) = 0 when z is outside.

5. Show that if f is analytic within and on a simple closed contour C and z_0 is not on C, then

$$\int_C \frac{f'(z) \, dz}{z - z_0} = \int_C \frac{f(z) \, dz}{(z - z_0)^2}.$$

6. Let f denote a function that is *continuous* on a simple closed contour C. Following a procedure used in Sec. 51, prove that the function

$$g(z) = \frac{1}{2\pi i} \int_C \frac{f(s) \, ds}{s - z}$$

is *analytic* at each point z interior to C and that

$$g'(z) = \frac{1}{2\pi i} \int_C \frac{f(s) \, ds}{(s-z)^2}$$

at such a point.

7. Let *C* be the unit circle $z = e^{i\theta}(-\pi \le \theta \le \pi)$. First show that for any real constant *a*,

$$\int_C \frac{e^{az}}{z} dz = 2\pi i.$$

Then write this integral in terms of θ to derive the integration formula

$$\int_0^{\pi} e^{a\cos\theta} \cos(a\sin\theta) \, d\theta = \pi.$$

8. (a) With the aid of the binomial formula (Sec. 3), show that for each value of n, the function

$$P_n(z) = \frac{1}{n! 2^n} \frac{d^n}{dz^n} (z^2 - 1)^n \qquad (n = 0, 1, 2, \ldots)$$

is a polynomial of degree n.*

^{*}These are Legendre polynomials, which appear in Exercise 7, Sec. 43, when z = x. See the footnote to that exercise.

172 INTEGRALS

(b) Let C denote any positively oriented simple closed contour surrounding a fixed point z. With the aid of the integral representation (5), Sec. 51, for the *n*th derivative of a function, show that the polynomials in part (a) can be expressed in the form

$$P_n(z) = \frac{1}{2^{n+1}\pi i} \int_C \frac{(s^2 - 1)^n}{(s - z)^{n+1}} ds \qquad (n = 0, 1, 2, \ldots).$$

(c) Point out how the integrand in the representation for $P_n(z)$ in part (b) can be written $(s + 1)^n/(s - 1)$ if z = 1. Then apply the Cauchy integral formula to show that

$$P_n(1) = 1$$
 $(n = 0, 1, 2, ...).$

Similarly, show that

$$P_n(-1) = (-1)^n$$
 $(n = 0, 1, 2, ...).$

9. Follow these steps below to verify the expression

$$f''(z) = \frac{1}{\pi i} \int_C \frac{f(s) \, ds}{(s-z)^3}$$

in Sec. 51.

(a) Use expression (2) in Sec. 51 for f'(z) to show that

$$\frac{f'(z+\Delta z)-f'(z)}{\Delta z} - \frac{1}{\pi i} \int_C \frac{f(s)\,ds}{(s-z)^3} = \frac{1}{2\pi i} \int_C \frac{3(s-z)\Delta z - 2(\Delta z)^2}{(s-z-\Delta z)^2(s-z)^3} f(s)\,ds.$$

(b) Let D and d denote the largest and smallest distances, respectively, from z to points on C. Also, let M be the maximum value of |f(s)| on C and L the length of C. With the aid of the triangle inequality and by referring to the derivation of expression (2) in Sec. 51 for f'(z), show that when $0 < |\Delta z| < d$, the value of the integral on the right-hand side in part (a) is bounded from above by

$$\frac{(3D|\Delta z|+2|\Delta z|^2)M}{(d-|\Delta z|)^2d^3}L$$

- (c) Use the results in parts (a) and (b) to obtain the desired expression for f''(z).
- 10. Let f be an entire function such that $|f(z)| \le A|z|$ for all z, where A is a fixed positive number. Show that $f(z) = a_1 z$, where a_1 is a complex constant.

Suggestion: Use Cauchy's inequality (Sec. 52) to show that the second derivative f''(z) is zero everywhere in the plane. Note that the constant M_R in Cauchy's inequality is less than or equal to $A(|z_0| + R)$.

53. LIOUVILLE'S THEOREM AND THE FUNDAMENTAL THEOREM OF ALGEBRA

Cauchy's inequality in Theorem 3 of Sec. 52 can be used to show that no entire function except a constant is bounded in the complex plane. Our first theorem here,
