

and, since (Sec. 7)

$$z_2^{-1} = \frac{1}{r_2} e^{-i\theta_2},$$

one can see that

$$(3) \quad \arg(z_2^{-1}) = -\arg z_2.$$

Hence

$$(4) \quad \arg\left(\frac{z_1}{z_2}\right) = \arg z_1 - \arg z_2.$$

Statement (3) is, of course, to be interpreted as saying that the set of all values on the left-hand side is the same as the set of all values on the right-hand side. Statement (4) is, then, to be interpreted in the same way that statement (2) is.

**EXAMPLE 2.** In order to find the principal argument  $\text{Arg } z$  when

$$z = \frac{-2}{1 + \sqrt{3}i},$$

observe that

$$\arg z = \arg(-2) - \arg(1 + \sqrt{3}i).$$

Since

$$\text{Arg}(-2) = \pi \quad \text{and} \quad \text{Arg}(1 + \sqrt{3}i) = \frac{\pi}{3},$$

one value of  $\arg z$  is  $2\pi/3$ ; and, because  $2\pi/3$  is between  $-\pi$  and  $\pi$ , we find that  $\text{Arg } z = 2\pi/3$ .

## EXERCISES

1. Find the principal argument  $\text{Arg } z$  when

$$(a) z = \frac{i}{-2 - 2i}; \quad (b) z = (\sqrt{3} - i)^6.$$

$$\text{Ans. } (a) -3\pi/4; \quad (b) \pi.$$

2. Show that (a)  $|e^{i\theta}| = 1$ ; (b)  $\overline{e^{i\theta}} = e^{-i\theta}$ .

3. Use mathematical induction to show that

$$e^{i\theta_1} e^{i\theta_2} \dots e^{i\theta_n} = e^{i(\theta_1 + \theta_2 + \dots + \theta_n)} \quad (n = 2, 3, \dots).$$

4. Using the fact that the modulus  $|e^{i\theta} - 1|$  is the distance between the points  $e^{i\theta}$  and 1 (see Sec. 4), give a geometric argument to find a value of  $\theta$  in the interval  $0 \leq \theta < 2\pi$  that satisfies the equation  $|e^{i\theta} - 1| = 2$ .

$$\text{Ans. } \pi.$$

5. By writing the individual factors on the left in exponential form, performing the needed operations, and finally changing back to rectangular coordinates, show that

$$(a) i(1 - \sqrt{3}i)(\sqrt{3} + i) = 2(1 + \sqrt{3}i); \quad (b) 5i/(2 + i) = 1 + 2i;$$

$$(c) (-1 + i)^7 = -8(1 + i); \quad (d) (1 + \sqrt{3}i)^{-10} = 2^{-11}(-1 + \sqrt{3}i).$$

6. Show that if  $\operatorname{Re} z_1 > 0$  and  $\operatorname{Re} z_2 > 0$ , then

$$\operatorname{Arg}(z_1 z_2) = \operatorname{Arg} z_1 + \operatorname{Arg} z_2,$$

where principal arguments are used.

7. Let  $z$  be a nonzero complex number and  $n$  a negative integer ( $n = -1, -2, \dots$ ). Also, write  $z = r e^{i\theta}$  and  $m = -n = 1, 2, \dots$ . Using the expressions

$$z^m = r^m e^{im\theta} \quad \text{and} \quad z^{-1} = \left(\frac{1}{r}\right) e^{i(-\theta)},$$

verify that  $(z^m)^{-1} = (z^{-1})^m$  and hence that the definition  $z^n = (z^{-1})^m$  in Sec. 7 could have been written alternatively as  $z^n = (z^m)^{-1}$ .

8. Prove that two nonzero complex numbers  $z_1$  and  $z_2$  have the same moduli if and only if there are complex numbers  $c_1$  and  $c_2$  such that  $z_1 = c_1 c_2$  and  $z_2 = c_1 \overline{c_2}$ .

*Suggestion:* Note that

$$\exp\left(i \frac{\theta_1 + \theta_2}{2}\right) \exp\left(i \frac{\theta_1 - \theta_2}{2}\right) = \exp(i\theta_1)$$

and [see Exercise 2(b)]

$$\exp\left(i \frac{\theta_1 + \theta_2}{2}\right) \overline{\exp\left(i \frac{\theta_1 - \theta_2}{2}\right)} = \exp(i\theta_2).$$

9. Establish the identity

$$1 + z + z^2 + \dots + z^n = \frac{1 - z^{n+1}}{1 - z} \quad (z \neq 1)$$

and then use it to derive *Lagrange's trigonometric identity*:

$$1 + \cos \theta + \cos 2\theta + \dots + \cos n\theta = \frac{1}{2} + \frac{\sin[(2n+1)\theta/2]}{2 \sin(\theta/2)} \quad (0 < \theta < 2\pi).$$

*Suggestion:* As for the first identity, write  $S = 1 + z + z^2 + \dots + z^n$  and consider the difference  $S - zS$ . To derive the second identity, write  $z = e^{i\theta}$  in the first one.

10. Use de Moivre's formula (Sec. 7) to derive the following trigonometric identities:

$$(a) \cos 3\theta = \cos^3 \theta - 3 \cos \theta \sin^2 \theta; \quad (b) \sin 3\theta = 3 \cos^2 \theta \sin \theta - \sin^3 \theta.$$

11. (a) Use the binomial formula (Sec. 3) and de Moivre's formula (Sec. 7) to write

$$\cos n\theta + i \sin n\theta = \sum_{k=0}^n \binom{n}{k} \cos^{n-k} \theta (i \sin \theta)^k \quad (n = 0, 1, 2, \dots).$$

Then define the integer  $m$  by means of the equations

$$m = \begin{cases} n/2 & \text{if } n \text{ is even,} \\ (n-1)/2 & \text{if } n \text{ is odd} \end{cases}$$

and use the above summation to show that [compare with Exercise 10(a)]

$$\cos n\theta = \sum_{k=0}^m \binom{n}{2k} (-1)^k \cos^{n-2k} \theta \sin^{2k} \theta \quad (n = 0, 1, 2, \dots).$$

(b) Write  $x = \cos \theta$  in the final summation in part (a) to show that it becomes a polynomial

$$T_n(x) = \sum_{k=0}^m \binom{n}{2k} (-1)^k x^{n-2k} (1-x^2)^k$$

of degree  $n$  ( $n = 0, 1, 2, \dots$ ) in the variable  $x$ .\*

## 9. ROOTS OF COMPLEX NUMBERS

Consider now a point  $z = re^{i\theta}$ , lying on a circle centered at the origin with radius  $r$  (Fig. 10). As  $\theta$  is increased,  $z$  moves around the circle in the counterclockwise direction. In particular, when  $\theta$  is increased by  $2\pi$ , we arrive at the original point; and the same is true when  $\theta$  is decreased by  $2\pi$ . It is, therefore, evident from Fig. 10 that *two nonzero complex numbers*

$$z_1 = r_1 e^{i\theta_1} \quad \text{and} \quad z_2 = r_2 e^{i\theta_2}$$

FIGURE 10

\*These are called Chebyshev polynomials and are prominent in approximation theory.
