

Write a one page response to the Nature article: “Scientists rise up against statistical significance”. Your response should be about 1-2 pages double spaced and should address the following questions. All responses should be in your own words.

1. Explain the comic at the beginning of the article.
2. What is meant by statistical “dichomania”?
3. Explain the risk ratio example in your own words. Why were the conclusions made by the second set of researchers misleading?
4. Compatibility interval is just another name for confidence interval. Explain how the authors suggest these compatibility intervals be interpreted. What are your thoughts on this interpretation?
5. Explain in your own words the 4 things to bear in mind when interpreting compatibility/confidence intervals.
